STK Individual Kiosk

Highlights of STK

- Sleek design in MS for industrial usage with a small footprint.
- Touch Screen based system with a touch pad & Keyboard.
- Quick program generation with audio, video & images.
- STK content is available in 11 Indian languages namely English, Hindi, Marathi, Gujarati, Kannada, Tamil, Telugu, Malayalam, Bangla, Odia, Assamese. The content is also available in Thai, Malay & Nepali language.
- Program evaluation module with a facility to generate completion certificates with photographs.
- Emergency Evacuation module with graphical display.
- Photograph & Finger print scanning for enhanced safety.
- Integration to access control & other system possible at additional cost.
- Sample programs for various industries.
- Risk & PPE matrix
- Hazard & First AID matrix

A 360° approach to Safety Training

A 360° approach to Safety Training

Safety is a matter of concern for every organisation today. Though it is not possible to avoid every untoward incident, preparedness and continual training is the path towards a secured and safe working environment. Training can be given in many ways but a classroom approach to safety training not only becomes monotonous but can also prove to be inefficient due to corner-cutting.

STK helps you in taking a 360 approach to safety training which ensures that all the stakeholders are trained as per their risk exposure and based on the overall impact on risk mitigation plan. This helps in the "Change Behaviour Phase" & "Evaluation phase" of BBS or Behaviour Based Safety and also helps in facing the safety audits like OSHAS or ISO 18000.

Brief About STK™

STK comprises of four major components as shown in the infographic below.

1. Models of STK : There are multiple models of STK . Based on the duration of the training program & the number of persons to be trained in one training session , the models can be chosen.

STK for Visitor Training : This is an individual training kiosk usually placed

in the reception or safety room near reception. and the safety training program runs for a maximum 2-3 minutes per person. The content is mostly do's & don'ts & emergency evacuation etc. The training is taken standing in front of the kiosk and hence a very small footprint is required.

STK for Drivers : This is an individual training usually placed at the material gate. The safety training runs for maximum 3-4 minutes and safety instructions are more specific to drivers. There is a breath analyzer available at the kiosk which can be used to determine the alcohol level of the drivers. The training is provided by standing in front of the kiosk.

STK for Contractors , GMP , SOP , Work Permit etc. : These are usually group training sessions . The training is provided on a large screen and the duration of the training is usually around 15-20 minutes. Hence the trainees sit in front of the kiosk as a group. For their evaluation a small remote similar to the famous TV show KBC is provided to every individual. These kiosks are usually placed inside the factory in a proper training room with a capacity to accommodate around 30 persons.

2. STK Pre-loaded Content : This is the most important part of any safety kiosk. STK has very rich content which runs in multiple hours. The content is

divided into different categories.

STK content is available in 11 Indian languages namely English, Hindi, Marathi, Gujarati, Kannada, Tamil, Telugu, Malayalam, Bangla, Odia, Assamese. The content is also available in Thai, Malay & Nepali language.

3. STK Content Creation : This is the main feature of STK . Using this module you can convert your existing PPTs for SOP , GMP Processes , Safety training etc. into safety training programs. Any Safety training videos that you might have purchased (without a lock or dongle) can also be added to STK using this module.

It offers a facility to create many evaluation questions and quizzes. By creating a question bank it is possible to retain the earlier questions for future usage.

4. Scheduling and Analytics : STK offers very rich features and integration to Labour Management System to ensure that every stakeholder is covered under safety training. Training Need identification module can suggest which individual should be trained on which module and the planning and reminders as emails and SMS can be sent.
